

LogicClass

One system for the whole school day

Admissions, enrolment, attendance, grades, fees, payroll, records, schedules, reports and safety - in one app your Director, Principal, Admin, Registrar, Faculty, Guidance, Staff, Students and Parents each sign in to and see only their own part of.

9 role portals

Android . Windows . Web

Live demo online

A demo walkthrough for schools

WHY SCHOOLS ASK FOR THIS

The paperwork a school day leaves behind

Every item below is somebody in the school building copying the same fact into a second place.

Records in five books

The class record, the registrar's ledger, the cashier's receipt book, the guidance file and the adviser's notebook - each holding part of one student.

Attendance copied twice

Called in the morning, written on a slip, then typed into a spreadsheet at the end of the week - if anyone gets to it.

Balances nobody agrees on

The cashier has one figure, the parent remembers another, and the only way to settle it is to find the receipts.

Form 137 takes days

A request comes in, somebody pulls the folder, copies the grades by hand, and nothing records that it was released.

Parents told last

A fever, a suspension, a summons to the guidance office - the family finds out when the child gets home.

No way to answer "who changed this?"

A grade moves, a balance is edited, a record disappears. Nothing in the school can say who, or when.

HOW IT IS ORGANISED

Nine portals, one school, one login each

Sign in once and the app opens on the portal for your role. Nobody chooses a mode, and nobody sees a screen that is not theirs.

Director

School-wide oversight, approvals, money and audit

Registrar / Cashier

Enrolment, records, fees, receipts, forms

Staff

Daily checklist, work log, material requests

Principal

Academic leadership for one division

Faculty

Coursework, grades, attendance, materials

Student

Subjects, timetable, marks, balance, ID

Admin

People, branding, catalogues, schedules, reports

Guidance

Counselling records and student summons

Parent

Every linked child in one place

Each account sees one portal. No shared screen, no shared password, no "admin mode".

Every button on the Director's screen

Opens on four live figures for today: attendance rate, collections, pending approvals and upcoming meetings.

- | | |
|--|---|
|  Announcements
Post to everyone or pick the roles; pin one to the top |  Reports
Enrolment, collections, attendance and grades - on screen, to Excel, or printed |
|  Meeting Scheduler
Title, description, location, start and end; cancel a meeting |  Fee Schedules
Define the fee sets the cashier assesses against |
|  Approvals
One inbox for every request in the school. Every decision records who made it, when, and what they were deciding |  Expenses
Record school spending by category, or import a spreadsheet of it |
|  Class Schedule
The week's timetable for every section, with clash detection |  Emergency Numbers
The list every phone in the school can dial from |
|  System Check
Seven readiness checks before a school goes live |  Audit Trail
Every change made in the school, filterable by module and date |
|  Data Requests
What families have asked about their data, and what was answered |  My Activity
The same trail, narrowed to what you did |

Academic leadership, scoped to one division

A Principal is set to Elementary, Junior High, Senior High or College - and the records they can open stop at that line. Oversight, not data entry: grades stay the teacher's, records stay the registrar's.

Student Records

Read the roster and any record in their division - view only.

Class Schedule

The week as it is actually timetabled, section by section.

Teacher Assignment

Who teaches which subject in which section, and who advises it.

Emergency Alerts

Live alerts raised in the school, with the power to resolve one.

Emergency Numbers

The school's published numbers, one tap to dial.

Announcements

Post school or division messages under their own name.

Meeting Scheduler

Call a meeting and say who it is for.

Approvals

Decide the requests that reach a division head - and the decision is signed with their account.

People, academics and the school's identity

The operator role: the person who keeps the school configured week to week.

Employee Management

Create an account for any role, set department, position and division scope

Teacher Assignment

Subject, section, school year, and who is the class adviser

Reset Password

Issue a temporary password; the employee is forced to change it at next sign-in

Strands & Programs

The Senior High strands and the college degree programs students enrol into

Activate / Suspend

Switch an account off without deleting anything it wrote

Class Schedule

Build the week: day, start, end, room - the app refuses a clash

Import employees

Bring a staff list in from Excel or CSV, or export the one you have

School Branding

Logo, printed name, address, school year, principal and director signatures

Money, safety, oversight and going live

The same account, on the other half of the dashboard.

Fee Schedules

Named fee sets per division, grade level and school year

Reports

The four school reports, exportable and printable

Announcements

Post and pin school messages

Scan Attendance

Open the camera and mark whoever is scanned, in or out

Emergency Alerts

See and resolve alerts raised anywhere in the school

Emergency Numbers

Publish the numbers every portal can dial

Data Requests

Answer a family asking what is held about their child

Audit Trail

Filter every change by module, date and person

System Check

Prove the deployment works before the first school day

Profile

Your own details, QR ID, activity and notification switch

The counter a family actually walks up to

Four tiles on the dashboard, and everything else opens from a student's own record.

Student Records

Search and filter the roster by division, register a new student, import or export the list, load more as you scroll.

Data Requests

The queue of families asking for access, correction, erasure or objection - each with a target answer date.

Online Payments

The review queue: every GCash or bank transfer a family sent in, with the reference and the amount, to approve or reject.

Payment Setup

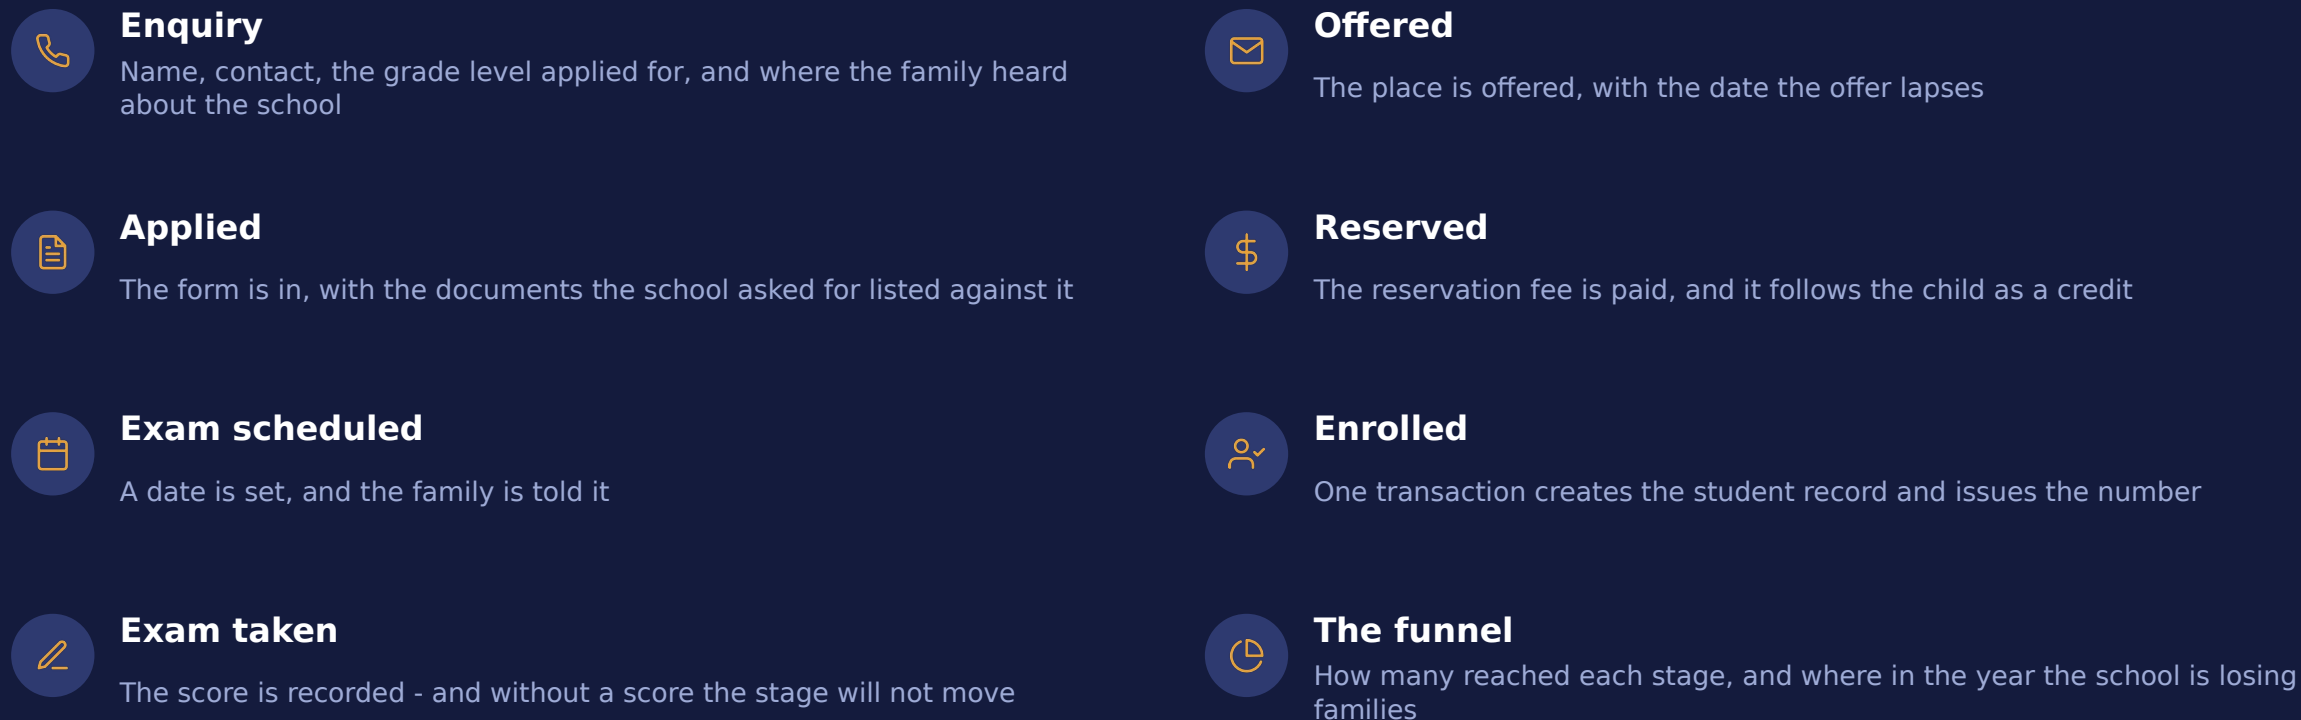

The school's own account name, number, QR image and the instructions families read before they send anything.

Registration issues a sequential student number - S-2026-000001 - that no app can invent or reuse.

ADMISSIONS

From the first phone call to a student number

Seven stages - and the screen opens on the enquiries nobody has moved in a week, longest wait first.

A stage cannot be wished forward: no score, no "exam taken"; no payment, no "reserved".

INSIDE ONE STUDENT RECORD

Nine actions, one screen

Open a student from the roster and everything the school does for that child is one tap away.

-  **Edit**
Name, grade level, section, status and guardian contacts
-  **Record Payment**
Cash, GCash or bank transfer, with a sequential receipt number and the balance in front of you
-  **Attendance History**
Every scan, in and out, with the status the server decided
-  **Photo**
Upload the picture that prints on the school ID
-  **Payment History**
Every charge, payment and refund, and how the balance is made up
-  **Create Portal Account**
Issue the student their own login - only when the school wants one
-  **Assess Fees**
Charge a fee schedule, or type an ad-hoc charge; void one that was wrong
-  **Records & Forms**
Print the Transcript of Records or Form 137, and log the release
-  **Set Balance**
An opening balance for a student carried over from the old system

The balance moves only inside a recorded payment or refund - never by an edit.

What a teacher opens between classes

Seven tiles, and none of them ask a teacher to be an administrator first.

My Schedule

Your own week - what you teach, when, where, to whom

Material Requests

File what you need; it lands in the same approvals inbox the Director reads

Coursework

Lesson plans, lessons, assignments, projects, exams and quizzes in one list

Scan Attendance

Mark your class present by scanning their IDs

Grade Submission

Pick subject and section, load the roster, enter scores against a maximum

Emergency Alerts

Raise or read an alert without leaving the room

Import grades

Bring a term's marks in from a spreadsheet instead of typing them

Announcements

Post to your own sections under your own name

Set work, mark it, and let it mark itself

Six kinds of coursework share one screen: Lesson Plan, Lesson, Assignment, Project, Exam and Quiz.

Set the work

Type, title, description, subject, section, due date and total points. Leave "Publish now" off and it saves as a draft only staff can see.

Answer key

Write the correct answers one per line and set the marks per question. Save the key and everything already handed in is re-marked against it.

Submissions

Who handed in, who is outstanding, who was late. Open one, give it a score and written feedback, or let the key score it.

The student side

The student answers question by question, sees the mark and the teacher's feedback, and can change their answer while it is still open.

A draft stays invisible to students until the teacher publishes it.

GRADING

Weighted the DepEd way, and printed as a Form 138

Written work, performance tasks and quarterly assessment - weighted per subject group by the school's own table.

The weights are the school's

Seeded with the DepEd Order 8 s.2015 groupings as a starting point, then edited and confirmed by a named person at the school.

A missing component is not a zero

In week two of a quarter no exam has been given. The grade is rescaled out of the weight that exists and names what is still missing, rather than capping every child at 80.

The report card

Form 138 on the school's own letterhead: every subject, every quarter, the final grade, the descriptor and the remarks.

Nothing prints unconfirmed

Until somebody at the school has checked the weights against the order current for them, the report card refuses to print - and editing them revokes the confirmation.

Two smaller roles, deliberately kept apart

One of these records is the most closely held in the system. The other is a work log nobody, including its author, can edit.

Guidance Records

Counselling notes against one student, by category. The guidance office, the Director and the division Principal - and nobody else, not even the class adviser.

Student Summons

Call a student to the office with a reason and a time. Visible to the student and the linked parent too: a family should not learn about it afterwards.

Staff Checklist

A personal task list for today. Add a task, edit it, tick it off. It resets with the date rather than piling up week on week.

Daily Reports

A short end-of-day work log. Written once and never editable - a correction is a new entry, so the record stays trustworthy.

Material Requests

Staff file into the same approvals inbox faculty use

Emergency Alerts

Guidance sees every alert raised in the school

My e-ID

Staff carry their own scannable ID for timekeeping

Ten things a student can check on their phone

A school can issue logins to every student, to some, or to none - a student record does not need an account to exist.

Subjects

Every subject, its teacher, and what has been posted in it

My Timetable

The week, day by day, with room and teacher

Assignments & Exams

The feed of published work, filterable by kind

Grades

Marks per subject and term, as the teacher submitted them

Attendance

Their own record, every scan, in and out

Payments & Balance

What was charged, what was paid, what is left - and how it adds up

Promissory Note

Ask for an extension with an amount and a reason

Emergency

One button that alerts the adviser and the parents

Announcements

Everything addressed to students

My QR ID

The school ID card, on the phone and printable

Every child in one place, without a second app

One account can be linked to several children. The dashboard is the list of them; opening one gives four tabs.

Attendance

Every day their child was scanned in, and whether it was on time.

Timetable

Where the child is meant to be, hour by hour.

Grades

Marks as the teacher submitted them, per subject and term.

Statement of Account

Charges, payments and the balance - read only. Refunds stay with the school.

Emergency Alerts

An unresolved alert about their child is shown as a banner, not hidden behind an icon

Announcements

Everything the school addressed to parents, pushed to the phone

Pay online

Send the fee by GCash or bank transfer and submit the reference for review

ATTENDANCE

A camera, a QR code, and no slips of paper

Every person in the school carries a QR ID. Staff roles carry a scanner. The scan itself decides the rest.

The ID card

A real card layout with the school logo behind it, the student's photo, and the principal and director signatures from Branding. Print it, or keep it on the phone.

The scan

Open Scan Attendance, point at the code, and the record is written. Scan again later and it is a time-out, not a duplicate.

Present or late

Decided on the server against the school's cutoff time and the school's timezone - not by the clock on the phone doing the scanning.

Who can see it

The student, their linked parent, and the staff roles allowed to. Attendance cannot be written from a client at all, only by the scan.

ATTENDANCE PER SUBJECT

The register the teacher takes, not just the gate

The gate scan says they came to school. It cannot say they were in Physics - which is the question behind a grade that dropped.

Time in

The teacher presses it at the start of the class. The whole section appears, marked present - so a register taken in a hurry still records the truth about everyone who was there.

Mark the exceptions

Present, late, absent, excused - one tap each. Three absences is three taps, not forty. Corrections allowed on the day, not after.

Time out

Ends the class, and records the finish time against everyone who was in it. Absent students get no time out, because they had no time in.

What the family sees

Every subject with its own attendance rate, worst first - because the reason anybody opens this screen is to find the one that is going wrong.

FEES AND PAYMENTS

From the fee schedule to a receipt in a parent's hand

Six steps, and the family can follow every one of them from their own account.

1. Define the fee schedule

A named set of fees for a division, grade level and school year - tuition, miscellaneous, books, whatever the school charges

4. Refund if needed

A refund is its own row against the original payment. Director and Admin only, enforced on the server

2. Assess the student

Charge a schedule against one student, or type an ad-hoc charge line by line. The total is shown before anything is committed

5. Show the family the arithmetic

Charged, paid, and what is left - with the assessments listed, so a balance is never a number nobody can explain

3. Take the payment

Type the number on the ID card and the student's name, class and balance appear. Nothing sends until the ID names somebody

6. Void a mistake, do not delete it

A wrong assessment is voided and stays visible. The history of a family's account is never quietly rewritten

BILLING

Instalments, discounts, vouchers and the exam permit

The four things a private school here does to a bill - and not one of them is a remark typed into a notes field.

Instalments with due dates

A schedule can be split - upon enrolment, then monthly - with a due date on every part. What is overdue becomes a date rather than an opinion.

A discount is a record

Sibling, early bird, staff child, scholarship: who granted it, on what authority, and against which charge. It can be revoked, and the revocation is a record too.

ESC and SHS vouchers

The subsidy is carried as a receivable from PEAC, not as a discount the school gave away. The family sees the net; the school still sees who owes the rest.

The exam permit

Cleared or not cleared, read from the ledger - so nobody is deciding at a desk on exam morning whether this family is up to date.

A school that writes a voucher off as a discount cannot say what PEAC still owes it. This one can.

ONLINE PAYMENTS

GCash and bank transfers, reviewed before they count

No gateway to sign up for and no percentage taken. The school publishes its own account, and a person approves what comes in.

The school sets it up

Account name, number, a QR image families can scan, and the instructions they read first.

The family sends it

They pay by their own app, then submit the reference number, the amount and what it was for.

The cashier reviews

A queue of everything awaiting review. Approve and it becomes a real payment with a receipt; reject and the family is told.

The cashier is told

A new submission raises an alert wherever the cashier is in the app - not only on the review screen.

No merchant account to open, no gateway percentage, and no payment counted until a person says so.

OFFICIAL RECEIPTS

BIR serials, issued once and reconciled

A booklet is registered with its Authority to Print number and its range. The app hands out serials from it, one at a time.

Register the booklet

The ATP number, the serial range it covers, and the date it was received

Printed as an OR

Payer, amount, what it was for, and the serial - on the school's own letterhead

One serial, once

Claimed on the server inside a transaction. Two cashiers pressing at the same moment cannot be handed the same number

Reconciled, gaps and all

Which serials were issued, which were cancelled, and which are simply missing - the question an audit opens with

The serial is not a number the app displays. It is a number the server gives out once and can never give out again.

PARENT AND TEACHER, TALKING

One thread per child, and nobody else in it

A parent can message the teachers who teach their child. Not the whole staff list - the teachers who actually teach them.

Who can reach whom

Worked out from the timetable, the section and the family link, every time a thread is opened. Nobody maintains a list, and nobody can message outside it.

Who can read it

The two of them. Not the Principal, not an administrator. A parent who believes the office is reading tells the teacher nothing worth reading.

One thread per child

A parent with two children taught by the same teacher gets two threads, so nobody has to say which child they mean.

What was said stays said

A message cannot be edited or unsent, and the sender is stamped by the server - nobody can post in the other person's name.

STAFF TIME AND LEAVE

The month a payroll clerk reads

The same scanner that marks students marks employees. This is where those scans become a month.

File it

Any employee files leave from their own screen. Working days are counted for them, weekends excluded, and the count is kept.

Decide it

One queue for the office, with the decided ones beneath it. Who decided, in what role, when, and why - and the employee is told.

The timesheet

Every day named as exactly one thing: worked, late, on leave, rest day, or absent. Approved leave is what turns a blank day from an absence into an authorised one.

Nothing is guessed

A day with a time in and no time out contributes no hours, and the sheet says how many such days there are. No invented hours reach a payslip.

PAYROLL

Salaries computed from the timesheet

Monthly, daily or hourly - whichever the contract says. Absences are costed at the period's own day rate, not a fixed twenty-two.

What goes in

Basic pay and allowances from the employee's compensation record; days worked, late and absent from the month already on the timesheet.

What comes out

SSS, PhilHealth, Pag-IBIG and withholding tax - contributions first, then tax on what is left. Net pay never falls below zero.

Server-computed

The rates, the tables, the scans and the approved leave are all read server-side. No figure on a payslip comes from the device that pressed Issue.

The payslip

A5, two to a sheet, your logo behind it, and the basis of every line on it - so an employee can check their own pay without asking anybody.

We ship no contribution tables. Your school types them from the circular in front of it, records which circular that was, and confirms - and no payslip prints until somebody has.

THE STOCK ROOM

What the school owns, and who is holding it

Every movement is a row - received, issued, returned, consumed, written off - and the quantity is what those rows add up to.

The item

Name, category, unit, reorder level, and where in the school it is kept

Received

A delivery, with the supplier and the document number against it

Issued

To a person, for a reason - the projector has a name against it

Returned

Back on the shelf, and the person who had it is clear

Low stock

What has fallen to its reorder level, before somebody needs it

Outstanding

What is out of the room right now, and who is holding each of it

The quantity is never typed in - it is the movements, added up.

NOBODY FINDS OUT TOO LATE

A push, and a record of it that is still there tomorrow

A push notification is gone the moment it is swiped away. Everything the school sends is also written to the person's own inbox.

An announcement

Reaches every account it is addressed to - and only those. Whose phone rings is decided on the server, not by a filter on a list

A leave decision

The employee who filed it. Somebody who never hears back either comes in when they should not have, or stays away when they were expected

A guidance summons

The student and every linked parent are told, and told again if the office calls it off. A family should not rearrange a day around an appointment that is not happening

A message

The other person in the conversation, named by the child it is about

An emergency

The class adviser and the student's parents, at high priority, with the app closed

And all of it, in one inbox

Reached from the bell in every portal. A phone that was off, or a browser that never granted permission, misses nothing

The Transcript and Form 137, printed and logged

The two documents a school is asked for most, generated from the records already in the system.

Print it

The Transcript of Records or Form 137, laid out on the school's own letterhead with its logo, address, school year and the principal and director signatures.

Say why

Purpose, who it was released to, their relationship to the student, and any remarks - captured at the moment of release, not remembered later.

Keep the history

Every release is listed with its date and copy count. When the receiving school writes back asking when Form 137 was sent, the answer is on the screen.

Print again

A reprint is recorded as a reprint. The count of copies in circulation stays honest.

Nothing is copied out by hand, so nothing is copied out wrong.

YEAR-END

Promoted, retained or graduated - decided once

The week every April that a school currently does by hand, on a printed list, in a room.

A decision per student

Promoted, retained, graduated or transferred out, taken against the final grades already held - with a reason recorded where the school needs one.

Nobody is decided by default

A student the school has not decided on is held, and held students are left out of the run entirely. Silence never quietly becomes a promotion.

The next level is not guessed

It comes from the school's own roster of grade levels. Where there is no next level, the app says so instead of inventing one.

Run it twice, safely

A student already rolled over is skipped rather than moved again, and the run reports how many were applied and how many were already done.

A promotion record is written once and never edited - a correction is a new record.

THE CLASS SCHEDULE

One room, one teacher, one section, one slot

Build the week block by block: subject, section, teacher, room, day, start and end.

Clashes are refused

Two classes in the same room, the same teacher in two places, or one section double-booked - the app names the conflict and will not save it. Checked again on the server before it is written.

Times the way people type them

7:30 AM, 7:30am, 07:30, 0730 - all understood. Nobody should have to learn a time format to build a timetable.

Printed as a grid

The week as a wall chart, with the section or the teacher dropped from the cells when it is the same all the way down.

Everyone sees their own

The teacher gets their week, the student gets theirs, the parent gets their child's - all from the same blocks.

REPORTS

The four numbers a school is actually asked for

Choose a period - this school year, this month, the last 30 days - and read it on screen, export it to Excel, or print it.

Enrolment by division

Head count by division and grade level, every status shown - not just the enrolled ones.

Collections and receivables

What was charged, what came in, and what is still owed.

Attendance rate by section

Present, late and absent by section, with the rate. Excused days sit outside the rate.

Grade distribution

Marks banded against the DepEd descriptors, per subject.

Export to Excel

The same table, as a spreadsheet you can rework

Print

A PDF with the school's heading and the totals row shaded

WHEN SOMETHING GOES WRONG

One button, and the right people know

Raised from a student's phone, seen by the staff who can act, and told to the family the same minute.

Raise it

A student presses one button and says what happened. Their adviser and their parents are notified.

See it

Faculty, Guidance, Principal, Admin and the Director see live alerts, and any of them can resolve one.

Tell the family

The parent gets a push, and a banner on their dashboard in case the push never arrived.

Dial out

The school's published numbers - clinic, guard, barangay, hospital - one tap from any portal.

Every alert is logged with who raised it, when, and who resolved it.

MOVING IN FROM WHAT YOU HAVE NOW

Excel in, Excel out - on five different lists

A school changing systems has years of data in spreadsheets. It does not get retyped.

Students

The whole roster, with divisions, sections and guardians

Grades

A term's marks, per subject and section

Teacher assignments

Who teaches what, to whom, this year

Employees

Staff with department, position and division scope

Expenses

The school's spending, by category and date

Blank template

Download the exact .xlsx shape the import expects

Every import shows you what it read before it writes anything, and every export comes back as .xlsx or .csv.

SECURITY

Not hidden in the app - refused by the database

Every rule below is enforced where the data lives, so it holds even if somebody bypasses the app entirely.

One school cannot see another

Every record lives under its own school, and an account carries the school it belongs to. There is no query that crosses the line.

Divisions hold too

A Junior High teacher scoped to their division cannot open a Senior High record - the read is denied, not filtered.

Sensitive fields are server-owned

A balance moves only inside a recorded payment. A role, a status or a student number cannot be changed by an app at all.

Everything is written down

Every create, edit and delete lands in the audit trail with who did it and when, automatically. A decision on a request is signed with the account that made it, so an approval cannot be attributed to somebody else.

What to hand your Data Protection Officer

Schools hold minors' records. The questions a DPO asks are answered inside the app, not in a promise.

A privacy notice in the app

Eight categories of data, what is held, why, and who sees it

Access requests

A family can ask what is held about their child, from their own profile

A retention schedule

How long each kind of record is kept, written down

A recorded acknowledgement

Every account reads it before their first use, and the version they read is stored

Correction and objection

The other rights the Act names, filed the same way

A clock on every request

Each one carries a target answer date and shows when it is overdue

A Data Processing Agreement template ships with the system, ready for your DPO to review.

WHERE IT RUNS

The same app, on whatever the school already has

One codebase, three builds. No separate teacher app, no separate parent app.

Android

Installed from an APK the school hands out itself. Camera scanning and push notifications, on the phones staff already carry.

Windows

A desktop build for the registrar's and cashier's counter, where the printing and the typing happen.

Web

Any browser, and installable to the home screen as a PWA - including iPhone, once added to the Home Screen.

Notifications

An announcement reaches the phones of the roles it was addressed to, even with the app closed.

One codebase means a fix reaches the registrar's desktop and the parent's phone together.

GOING LIVE

Seven checks that go green before the first school day

Built because the worst time to find a misconfiguration is on the morning a school starts using the system.

-  **Database reachable**
A real read from the school's own records returns
-  **File storage writable**
A probe file is written and removed again
-  **Security rules deployed**
A write the rules must refuse IS refused - the check that matters most
-  **Account claims set**
The signed-in account carries its role and its school
-  **Server functions deployed**
Every callable answers, in the right region
-  **School details filled in**
Name, logo, year, principal and DPO - a warning, not a failure
-  **Database indexes created**
The queries the app depends on actually run

A database left in test mode behaves perfectly - right up to the day one school reads another's records. This is the check that catches it.

See it with your own school's data

Bring one section's roster, one term of grades and last month's collections. We load them in front of you, and you click through the portals your own staff would use.

Or try it before you believe any of it:

logicclass.vercel.app

Twelve accounts, one per role. Nothing to install, and nothing you type into it is kept.
